Novel monoclonal antibody, useful for detecting B.anthracis, and for treating B.anthracis infection, is specifically reactive against Bacillus anthracis and is non-reactive with B.thuringinesis and B.cereus.

Claim 6; Fig 1; 27pp; English.

The present invention relates to a monoclonal antibody which is specifically reactive against Bacillus anthracis EA1 antigen. The present sequence is the mature EA1 protein from Bacillus anthracis. The EA1 protein corresponds to the eag gene. The monoclonal antibody is highly specific for Bacillus anthracis, and can distinguish Bacillus anthracis from closesly related non-pathogenic species. The present sequence is useful for producing a vaccine against Bacillus anthracis and the antibody is useful for treating, preventing or controlling Bacillus antibody is useful for treati anthracis infection (anthrax)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               501
                                                                                                                                                                                                                                                                                              The present sequence represents a bacterial surface array protein (SAP). SAP is used in the method of the invention. The specification describes a method for detecting the presence of Bacillus anthracis in a test sample. The method comprises contacting the sample with a capture reagent and detecting whether the a SAP is bound to the capture reagent, which is indicative of the presence of B. anthracis in the sample. The method is useful for detecting the presence or absence of B. anthracis in a test

Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular

proliferation or the activity of a gene in an operon required for compound that has an activity against a blological pathway required for proliferation, or that has an activity against a blological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or the gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profilling a compound s activity; (11) a culture comprising strains in which the gene or which each of the strains is present in a culture or collection of product is overexpressed or underexpressed; (12) determining the extent of the strains; or (13) identifying the target of a compound that inhibits the complement of an organism. The antisense nucleic acids are useful for graining proteins or screening for homologous nucleic acids required for proliferation to isolate candidate molecules for rational culture displaying proteins or screening for homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, C. required for proliferation in cells other than S. aureus, S. typhimurium, the traget prokaryotic essential genes. Note: The sequence data for this patent did not form part of the prished specification, but was obtained completed province of the prished province of the prished province of the present sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       120

C The invention relates to an isolated mucielic acid compitising any one of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibite proliferation of a cell. Also included are:

(1) a vector comprising a promotrer operably linked to the mucleic acid encoding a polypeptide whose expression is inhibited by the antisense mucleic acid; (2) a host cell containing the vector; (3) an isolated the polypeptide or its fragment whose expression is inhibited by the antisense mucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway crequired for proliferation, (7) identifying a cellular proliferation or the biological pathway in which a proliferation required for compound that inhibits encolleration of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound, a activity; (11) a culture comprising strains in which the gene compound, activity; (11) a culture comprising strains in which the gene compound, activity; (11) a culture comprising strains in which the gene compound, activity; (11) a culture comprising strains in which each of the strains is present in a culture or collection of compound the strains; or (13) identifying the target of a compound that inhibits the collection of an organism. The antisense nucleic acids are useful for proliferation of an organism. The antisense nucleic acids are useful for cellular proliferation in cells other than S. aureus, S. typhimurium, C. the target prokaryotic essential genes. Note: The sequence data for this patent did not form what directly from WIPO at the printed sequence is conded by one of the target promise or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence is conded by one of the target promise or P. aeruginosa. The present sequence is e New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs. The invention relates to an isolated nucleic acid comprising any one of Claim 25; SEQ ID NO 45560; 1766pp; English.

screening New antisense nucleic acids, useful for identifying proteins or scre for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

SEQ ID NO 45308; 1766pp; English.

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibites proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated completed or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding can polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of required for proliferation, or that has an activity against a biological pathway in which a proliferation required gene product or that has an activity against a biological pathway in which the test compound that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture compusing strains in which the test compound that inhibits proliferation of an organism. The antisense nucleic acids are useful for cellular proliferation of an organism. The antisense nucleic acids required for cellular proliferation of an organism. The antisense nucleic acids required for cellular proliferation of an organism. The antisense nucleic acids required for a cellular proliferation of an organism. The antisense nucleic acids required for cellular proliferation of an organism. The antisense nucleic acids required for the processed or the strains is processed and the candidate molecules for a capital and an organism of an organism and the candidate molecules for a capital and an organism and the candidate molecules for a capital and an organism and the can by one of for this drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of pneumoniae or P. aeruginosa. The present sequence is encoded by one ce target prokaryotic essential games. Note: The sequence data for this tent did not form part of the printed specification, but was obtained electronic format directly from WIPO at tp.wipo.int/pub/published_pct_sequences

CC (1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibiting aclated polypeptide or its fragment whose expression is inhibiting cellular cantisense nucleic acid; (4) an antibody capable of specifically binding cellular proliferation or the activity of agene in an operon required for proliferation or the activity of agene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene product is expensed for cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound sactivity; (11) a culture comprising strains in which the strent compound strains in which the extent or organism; or (13) identifying the target of a compound that inhibits the computed of an organism. The antisense nucleic acids are useful for the strains; or (13) identifying the target of a compound that inhibits collection of cragined for proliferation in cells other than S. aureus, S. typhimurium, C. crugalized for proliferation in cells other than S. aureus, S. typhimurium, C. crugalized for proliferation in cells other than S. aureus, S. typhimurium, C. che target prokaryotic essenting lense. Promoter regions of the gene are used in genetic constructs providing surface expression of heterologous proteins in P-1 hosts

                                                                                                                                                                                                   The present sequence is the Bacillus stearothermophilus PV72 S-layer protein, sbs-B. S-layer structures can be used as vaccines or adjuvants, particularly when they include a bacterial ghost that may contain additional epitopes in its membrane. Other uses of recombinant sbs-B, depending on the nature of the inserted peptide, are as an universal carrier for biotinylated reactants for use in immunological or hybridisation assays (the insert is streptavidin), to induce immune responses (epitopes), as a reagent for removing cytokine or toxin from serum (antigenic epitopes), as amolecular spinning nozzle (polyhydroxybutyrate synthase) and as a molecular laser (luciferase). (Updated on 17-0CT-2003 to standardise OS field)

```
This invention describes a novel host cell (A) comprising at least two befunctional recombinant polypeptides (I), at least one being in carrier bound form. The products of the invention have antibacterial activity.

(A), or, where bacterial, their ghosts (B), are useful as vaccines or adjuvants (specifically for presentation of immunospanic espitopes of pathogens or autologous immunostimulatory polypeptides, e.g. cytokines), or preferably, as enzyme reactors for performing a cascade of reactions, or preferably synthesis of poly(hydroxyalkanoate). Localization of individual (I), specifically enzymes, in separate cellular compartments avoids adverse reactions between products and substrates, when being used
                                                                                    592
                                                                                                                                                                                                                                   667
                                                                                                                                                                                                                                                                                                                                                                                                   643
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Host cell, useful e.g. as bioreactor for production of poly(hydroxyalkanoate), containing two or more recombinant polypeptides, with at least one in carrier-bound form.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      593 -DKIVNGKVEVKYFKNASD---TTPTSTKTITVNVVNVK-ADATPVGLDIV----APSKI

                                                                                                                                                                        Peptide
                                                                                                                                                                                           Protein
```

This invention describes a method for the production of a S-layer protein comprises (a) preparing a Gram-negative prokaryotic host cell transformed with nucleic acid (II) inhocked to a signal sequence (SS) that encodes a protein which causes at least one of (i) into the external or cytoplasmic membranes and/or (ii) secretion of (I) into the periplasmic space or extracellular medium. (b) culturing the call to express (I) and (c) optionally recovering (I) from the membranes, periplasmic call is and/or extracellular medium. (b) culturing the call to express (I) and (c) optionally recovering (I) from the membranes, periplasmic call is used as host and then the SS, which is optional, promotes integration into the extracellular medium. (c) is optional, promotes integration into the extracellular medium. (c) are useful as (i) vaccines or and variety of polypeptide inserts and are useful as (i) vaccines or adjuvants (with immunogenic epitopes or immunostimulants inserts such as cytokines) (ii) as reactors (inserts are enrywes, e.g. polyphydroxybutyrate (PHB) synthase for use as a 'molecular spinnerette' for production of PHB or luciferase for use as a molecular contined with substrate and oxygan) and (iii) as universal carrier molecule (streptavidin is inserted) for use in hybridisation and immuno assays, or for selective elimination of cytokines, toxines tor, from body fluids (inserte are specific binding epitopes). In this system, heterologous [1] do not form inclusion bodies but rather monomolecular layers, and in eukaryotic cells they undergo glycosylation. This sequence represents the Bacillus stearothermophilus sbsB protein which is used to illustrate the method of the invention. (Updated on 17-OCT-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                  The isolation and purification of the high molecular weight protein enables the identification of the major protective epitopes of the protein by conventional epitope mapping. These epitopes can then be synthesised using standard techniques and incorporated into fully synthetic or recombinant vaccines. (Updated on 25-MAR-2003 to correct

                                        This protein comprises the high molecular weight surface protein HMW3 (125 kba) of non-typeable Haemophilus influenzaes strain 5 that has the immunological ability to protect against disease caused by a non-typeable Haemophilus strain and is characterised by at least one surface-exposed Beneficope that is recognised by monoclonal antibody ADG. The HWW3 amino acid sequence was deduced from an isolated hmw3 gene (see AAN30291). HMW1 (see AAW30294) and HMW4 (see AAW30292) have also been identified. A conjugate comprising HWW3 inked to an antigen, hapten or polyaaccharide, and a synthetic peptide of 6-150 amino acids corresponding to at least protective epitope of HWW3 are also claimed. HWW proteins, conjugates and peptides can be used in vaccines, as immunogens for preparation of antibodies and as antigens for detection of these antibodies. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ---ATAGKATVELVOETIAIKSVNFKPVOTENFVEKKINIGTVLELEKSNLDDIVK-G 729

The gene encoding the protein was isolated from Bacillus sp. KSM-365 chromosomal DNA and inserted into the E.coli vector BR322. The gene was subsequently used to produce expression vectors contg. a 1071 fragment of the gene covering amino acid residues 228-584 (AAQ94349). The expression vectors contg. the fragment were transformed into B.subtilis for production of the protein. The novel alkaline cellulase has high specific activity in an alkaline environment and is stable over wide ranges of temp. and pit, and has full activity in the presence of surface active agents and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 US-09-137-531-15

US-09-137-531-15

Sequence 15, Application US/09137531

Patent No. US20020046816A1

GENERAL INFORMATION:
APPLICANT:
TITLE OF INVENTION: Expression of surface layer proteins
NUMBER OF SEQUENCES: 25

COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk

COMPUTER: IBM PC compatible

COMPUTER: IBM PC compatible

COMPUTER: IBM PC compatible

COMPUTER: IBM PC compatible

SOFTWARE: PatentIn Release #1.0, Version #1.30 (BPO)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

US-08-682-517-15
Squence 15, Application US/08682517
Patent No. 5874267
GENERAL INFORMATION:
PAPPLICANT:
TITLE OF INVENTION: Expression of surf
NUMBER OF SEQUENCES: 25
COMPUTER READABLE FORM:
MUNDIUM TYPE: Floppy disk'
COMPUTER: IBM PC Compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Ver
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/682,517
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        FILING DATE:
CLASSIFICATION:
INFORMATION FOR SEQ ID NO: 15
SEQUENCE CHARACTERISTICS:
LENGTH: 1222 amino acids
TOPOLOGY: linear; MOLECULE TYPE: protein US-08-682-517-15
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            amino acid

Patent No. 6218141

GENERAL INFORMATION:
APPLICANT: Barenkamp, Stephen J
TITLE OF INVENTION: High Molecular Weight Surface Proteins
TITLE OF INVENTION: of No. 6218141-Typeable Haemophilus
NUMBER OF SEQUENCES: 10
CORRESPONDENCE: Shoemaker and Mattare, Ltd.
STREET: 2001 Jefferson Davis Hwy., 1203 Crystal Plaza
STREET: Bldg. 1
CITY: Arlington
STATE: Virginia
COUNTRY: U.S.A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ZIP: 22202-0286

S-layer-encoding gene.";
Gene 173:189-194 (1996).
-!- PUNCTION: The S-layer is a paracrystalline mono-layered assembly of proteins which coat the surface of bacteria.
-!- SUBCELLULAR LOCATION: Call wall.
-!- SIMILARITY: Contains 3 S-layer homology (SLH) domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             23; Gaps
